_____

Once I had my idea I started with sketches, I wanted to include the ramen noodle texture as seen in the header and footer. After I had some sketches, I created three mockups in adobe illustrator. I chose the color packet based on the color of the noodles and their packaging, a soft cream for the background, and black and yellow for the main colors. I chose the mockup I was happiest with and started to create the HTML document. After adding the content and splitting it into divs I started on the CSS once I took a picture of my ramen dinner. The CSS brought some frustrations with some weird white space but after some debugging and some feedback from the instructor I was able to get rid of any unwanted spacing. I ended up having to make sure everything besides the sidebar was floating right, which got rid of the whitespace on the right side of the site. I also ended up creating two more divs to have more control over the content within the "icon" area and the "steps" area. Doing this I was able to give the areas 100% width which solved the problem of the unwanted whitespace when you stretched the website farther than it was supposed to be.
